

Business Model Canvas

Ajay Kaaran Gupta

On: 11/06/2026

Iteration #8

Passion

Skills :

- Backend Engineering
- AI Automation
- Business Process Automation
- System Integration
- Performance Scaling
- Tech Leadership
- Data Analytics & Reporting

Passion: Solving business bottlenecks with technology.

Market: Wealth

How I Help Businesses

- Save time
- Reduce operational cost
- Handle more customers
- Improve reliability
- Automate work
- Increase revenue
- Integrate Systems
- Scale without hiring too many people

Niche

Niche: Tech companies hiring senior engineering talent, struggling with weak technical screening, irrelevant profiles, slow interview cycles, poor candidate quality, and too much engineering bandwidth wasted on unqualified candidates.

Target Persona: Founder / CTO / VP Engineering / Head of Engineering / Head of Talent
Business: B2B SaaS companies, AI startups, fintech/product companies, IT services firms, GCCs, and tech-enabled businesses hiring Backend, Platform, Data, GenAI Application, and Engineering Lead roles.

Size: 20–500 employees or companies hiring 3–20 senior engineering roles per quarter.

Stack: LinkedIn / Naukri / Instahyre / Cutshort / Wellfound + ATS like Greenhouse / Lever / Zoho Recruit / Workable + coding tests + technical interviews + hiring manager feedback.

KPI: Time-to-hire, quality of shortlist, interview-to-offer ratio, candidate rejection rate, technical screening accuracy, hiring manager bandwidth, offer acceptance rate, and role closure speed.

Persona Beliefs:
"Recruiters don't understand technical depth."
"We get too many keyword-matched but weak profiles."
"My engineers are wasting time in first-round interviews."
"Good senior engineers are hard to identify from resumes."
"We need someone who can screen like an engineering leader."
"Hiring delays are slowing down product delivery."
"Generic staffing agencies don't understand Backend, Platform, Data, or AI roles."

Terms They Use: Backend engineer, platform engineer, data engineer, GenAI engineer, tech lead, engineering manager, Java, Spring Boot, microservices, system design, AWS, Kubernetes, Kafka, Spark, SQL, CI/CD, scalability, technical screening, coding round, LLD, HLD, DSA, hiring pipeline, shortlist, offer ratio, time-to-fill.

Problem

Problem

Domino Problem:

Companies cannot reliably identify truly strong senior engineers before wasting expensive interview bandwidth.

Senior engineering hiring looks simple from the outside: source profiles, screen resumes, schedule interviews, and close candidates.

But the real problem is that most recruiters and staffing vendors cannot judge technical depth.

They depend on keywords like Java, Spring Boot, Kubernetes, Kafka, AWS, Spark, GenAI, system design, and leadership experience without knowing whether the candidate can actually solve real engineering problems.

This creates weak shortlists, slow hiring, frustrated engineering teams, and delayed product execution.

This shows up as:

- CTOs and engineering leaders spend too much time interviewing weak candidates
- Recruiters send keyword-matched resumes that look good but fail technical rounds
- Senior engineers clear HR screening but collapse in system design or deep technical discussions
- Hiring managers lose trust in internal recruiters and external agencies
- Roles remain open for months because the shortlist quality is poor
- Good candidates are missed because recruiters cannot assess real engineering ability
- Interview panels become overloaded and frustrated
- Product delivery slows down because critical engineering seats remain empty
- Talent teams struggle to explain why candidates are getting rejected
- Founders feel hiring is active, but actual role closure is not happening

What they have already tried:

Generic recruitment agencies, internal talent teams, LinkedIn sourcing, Naukri, Instahyre, Cutshort, coding test platforms, ATS filters, referral drives, freelance recruiters, HR screening calls, recruiter scorecards, and basic AI resume matching tools.

Why these fail:

These methods can find profiles, but they do not consistently verify real engineering depth, system design maturity, production experience, problem-solving ability, and senior-level ownership before the candidate reaches the hiring manager.

Opportunity Cost:

They lose engineering time, delay product roadmaps, miss strong candidates, make slow or wrong hiring decisions, overload interview panels, and allow poor hiring quality to directly impact growth, delivery, and team morale.

Unique Value Proposition

UVP : Engineer-Led Technical Hiring Quality Layer: We help tech companies hire pre-vetted senior Backend, Platform, Data, GenAI Application, and Engineering Lead talent by adding real engineer-led technical screening before candidates reach hiring managers.

We are not just another recruitment agency. We reduce bad technical interviews and improve shortlist quality.

Must Haves:

- Role requirement discovery with founder/CTO/hiring manager
- Technical JD calibration
- Candidate sourcing support
- Resume and LinkedIn screening
- Recruiter screening call
- Engineer-led technical screening
- Role-specific evaluation scorecard
- System design and production experience check
- Communication and ownership assessment
- Shortlisted candidate report
- Interview coordination support
- Candidate feedback loop
- Replacement support for rejected shortlisted candidates
- Clear hiring pipeline tracking

Performance Layer:

1. Engineer-Led Screening

Candidates are screened by someone who understands real backend, platform, data, infra, and AI application work.

Impact: Hiring managers meet fewer weak candidates.

2. Senior Talent Quality Filter

Checks system design maturity, production ownership, debugging ability, scalability thinking, and leadership depth.

Impact: Shortlists become sharper and more trusted.

3. Hiring Manager Bandwidth Saver

Filters candidates before expensive engineering interviews.

Impact: CTOs and senior engineers save time.

4. Role-Specific Scorecard

Every candidate is evaluated against the actual role, not generic keyword matching.

Impact: Talent teams know why a candidate is strong or weak.

Delighter Layer:

1. Technical Selection Pattern Report

Shows why candidates are failing: DSA, system design, depth, communication, ownership, or role mismatch.

Impact: Company improves hiring criteria quickly.

2. Interview Readiness Brief

Gives hiring managers a one-page candidate summary before the interview.

Impact: Interviews become faster and more focused.

3. Market Signal Report

Shares insights on candidate availability, salary expectations, notice periods, and role difficulty.

Impact: Founders and CTOs make better hiring decisions.

Guarantee: Vetted Shortlist Quality Guarantee

If shortlisted candidates do not match the agreed technical scorecard, we re-screen and replace profiles at no extra screening fee until the agreed shortlist quality is met.

Conditional Terms:

This applies only if the client shares

- clear role requirements
- salary range
- interview process
- feedback on submitted candidates
- decision timelines
- one hiring manager/technical reviewer within agreed timelines.

Channels

Primary:

LinkedIn

Secondary: Cold email, founder communities, CTO communities, engineering leadership groups, SaaS communities, startup communities, HR/talent leader communities, referrals, and niche recruiter partnerships.

Avoid Initially: Facebook/Instagram ads, job-board ads, mass hiring campaigns, and broad recruitment marketplaces.

Mechanism:

- LinkedIn Outbound + Organic Authority Content
- Connect with founders, CTOs, VP Engineering, Heads of Engineering, and Talent Heads
- Target tech companies hiring senior Backend, Platform, Data, GenAI, and Engineering Lead roles
- Send outreach around weak shortlists, wasted technical interviews, and slow senior role closures
- Post content on bad technical screening, resume keyword traps, system design gaps, hiring manager bandwidth, and senior engineering hiring mistakes
- Share sample technical scorecards
- Share before/after shortlist quality examples
- Use cold email for scaled follow-up
- Use referrals from CTOs, engineering managers, founders, and HR consultants for warmer trust

Competitor Analysis

Generic Recruitment Agencies:

Generic recruiters help companies source and submit candidates.
They depend heavily on resumes, keywords, notice period, salary fit, and basic HR screening.
They can create volume, but usually cannot judge deep technical ability.
They often send profiles that look relevant but fail in technical interviews.
Simple note: Generic agencies help fill the top of the funnel, but they usually do not solve technical quality filtering.

HackerRank / Codility:

These are coding assessment and technical screening platforms.
They help companies test coding ability, problem-solving, and technical skills.
They are useful for structured assessments and early filtering.
But they may not fully capture production ownership, system design maturity, debugging judgment, communication, and senior-level decision-making.
Simple note: Coding platforms test skills, but they do not fully replace senior engineer judgment.

Karat:

Karat provides outsourced technical interviews through interview engineers.
It helps companies run structured technical interviews.
It can reduce internal interview load.
But it is more of an interview platform/service, not a niche recruitment partner that sources, screens, calibrates, and manages shortlist quality end-to-end.
Simple note: Karat helps run interviews. We help companies get better-fit candidates before the interview stage.

Turing / Vetted Talent Networks:

Turing and similar platforms provide access to vetted remote developers.
They focus on matching companies with pre-vetted technical talent.
They are useful when companies want talent from a large external network.
But they may not deeply customize for local hiring, company-specific role nuance, salary reality, culture fit, and hiring manager feedback loops.
Simple note: Vetted talent networks provide talent pools. We provide role-specific engineer-led hiring quality control.

Comparison:

- Generic recruiters send resumes. We send engineer-vetted candidates.
- Coding-test tools evaluate tasks. We evaluate real role fit, system design, ownership, communication, and production maturity.
- Interview platforms run interviews. We reduce the number of weak interviews before they reach the hiring manager.
- Talent networks provide pre-vetted pools. We build a custom shortlist for the client's exact role, stack, salary, and urgency.
- We are not replacing the company's hiring process. We improve the quality layer before technical interviews.
- Our strength is not just sourcing. Our strength is technical judgment.
- We help talent teams explain why a candidate is strong, weak, risky, or mismatched.
- We are easier for growing tech companies to adopt because we work with their existing ATS, recruiters, interview process, and hiring managers.
- Our promise is narrower, so it is sharper: fewer weak candidates, fewer wasted technical interviews, better senior engineering shortlist quality.

Simple position on line:

Minimum Viable Product

TechFit Hiring Engine: Engineer-Led Screening Pilot + Managed Vetted Shortlist System

Island 1: Hiring Quality Blind Spot

- You recruiters, sourcing channels, resumes, coding tests, and technical interviews are disconnected.
- Resumes look strong, but real engineering depth is unclear
- Recruiters cannot judge system design, ownership, or production maturity
- Hiring managers waste time interviewing weak candidates
- Senior roles stay open for weeks or months
- Talent teams do not know why candidates are failing
- Interview panels lose trust in shortlisted profiles
- Product delivery slows down because critical roles remain unfilled

Island 2: Engineer-Vetted Hiring Layer

- Every shortlisted candidate is technically screened before reaching hiring managers
- Candidates are assessed for real role fit, not just keywords
- CTOs receive interview-ready candidate briefs
- Talent teams get clear rejection reasons and hiring signals
- Hiring managers spend time only on serious candidates
- Senior Backend, Platform, Data, GenAI, and Engineering Lead roles close faster

Phase 1: Build the Technical Quality Filter

- Quality company, role, salary, urgency, and hiring process
- Review JD, current pipeline, rejected profiles, and interview feedback
- Define must-have skills, good-to-have skills, and rejection triggers
- Create role-specific technical scorecard
- Screen resumes and LinkedIn profiles for real experience
- Conduct engineer-led technical screening calls
- Assess system design, production experience, debugging, ownership, and communication
- Reject weak candidates before they reach hiring managers

Outcome: Only technically relevant candidates move forward with a clear role-specific quality filter.

Phase 2: Deliver the Vetted Shortlist

- Share shortlisted candidates with technical scorecards
- Provide one-page interview readiness briefs
- Highlight strengths, risks, salary expectation, notice period, and role fit
- Coordinate feedback with hiring manager
- Refine screening based on interview outcomes

Outcome: Hiring managers interview fewer but better candidates.

Phase 3: Improve & Scale Hiring Motion

- Track rejection patterns
- Improve JD, screening filters, and candidate pitch
- Share market signals on role difficulty, salary, notice period, and talent availability
- Build repeatable hiring pipeline for similar roles
- Add ongoing hiring support for multiple senior tech roles

Outcome: Client gets a repeatable senior engineering hiring system without depending on generic recruiters, keyword matching, or overloaded interview panels.

Engineer-Led Hiring Readiness:

Instead of depending on resumes, recruiter judgment, coding-test scores, or first-round interviews by busy engineers, you get one quality layer that verifies technical depth before candidates enter the hiring manager's calendar.

Unique Mechanisms

1. Technical Truth Filter

A role-specific screening layer that separates real engineering depth from resume keywords.

Why it works: It catches weak candidates before they waste interview bandwidth.

2. Hiring Manager Bandwidth Shield

A process where only engineer-vetted candidates reach CTOs, tech leads, and interview panels.

Why it works: It protects expensive engineering time and restores trust in shortlists.

3. Senior Talent Signal Scorecard

A scorecard that evaluates system design, production ownership, debugging, scalability, communication, and role fit.

Why it works: It gives talent teams clear reasons behind selection and rejection.

4. Interview Readiness Brief

A one-page candidate intelligence report shared before the technical interview.

Why it works: Hiring managers enter interviews with context, risks, and sharp evaluation points.

5. Rejection Pattern Intelligence

A feedback loop that shows why candidates are failing across roles and stages.

Why it works: The company improves hiring criteria instead of repeating the same screening mistakes.

Market Message

For tech companies hiring senior Backend, Platform, Data, GenAI Application, and Engineering Lead talent, we help you get out of weak shortlists, wasted technical interviews, and slow role closures by delivering engineer-vetted candidates in 30–45 days using our TechFit Hiring Engine — without relying on generic recruiters, keyword-matched resumes, overloaded interview panels, or basic AI resume filters.

Price

Pricing Model: Hiring Diagnostic + Role Engagement Fee + Success Fee

1 month salary of hiring position.

Delivery

Delivery Model: DFY + DWY engineer-led recruitment support with role calibration, sourcing assistance, technical screening, shortlist delivery, and hiring manager feedback loops.

Support Type: Async-first support through email/shared tracker, with scheduled role calibration calls, weekly hiring reviews, and candidate feedback checkpoints.

Client Responsibility: Client provides JD, salary range, hiring urgency, interview process, must-have skills, rejected profiles, feedback on candidates, interview availability, offer process, and one hiring manager/technical reviewer.

Implementation Flow:

- Role Discovery : Understand company, product, tech stack, role expectations, must-have skills, salary range, and hiring urgency.
 - Hiring Gap Diagnosis : Review current JD, failed profiles, rejection reasons, and interview bottlenecks.
 - Scorecard Setup : Create role-specific technical scorecard for Backend, Platform, Data, GenAI, or Engineering Lead roles.
 - Candidate Sourcing : Source candidates through LinkedIn, Naukri, Instahyre, Cutshort, referrals, and existing networks.
 - Resume & Profile Screening : Filter candidates for real experience, role fit, seniority, stability, and compensation alignment.
 - Engineer-Led Technical Screening : Assess system design, production ownership, debugging ability, scalability thinking, communication, and leadership maturity.
 - Vetted Shortlist Delivery : Share shortlisted candidates with scorecards, strengths, risks, notice period, salary expectation, and interview readiness brief.
 - Feedback & Refinement : Review hiring manager feedback, improve filters, adjust scorecard, and refine candidate pipeline.
 - Closure Support : Support interview coordination, candidate follow-ups, offer alignment, and replacement support as per agreed terms.
- Response Time:** 24–48 business hours, Monday–Friday.
Support Boundaries: No unlimited WhatsApp, no daily calls, no guarantee of candidate joining, no ownership of final hiring decision, no salary negotiation beyond agreed support, no employer branding work, no HR compliance ownership, and no unlimited roles outside agreed scope.

ROI Mapper

ROI Mapper:

The offer creates ROI by reducing wasted technical interviews, improving shortlist quality, closing senior engineering roles faster, and protecting expensive CTO/engineering team bandwidth.

Primary ROI Drivers:

- Hiring managers interview fewer weak candidates
- Senior engineers spend less time in low-quality interviews
- Shortlists become technically stronger and more trusted
- Roles close faster because screening quality improves
- Talent teams understand why candidates pass or fail
- Product delivery delays reduce when critical roles are filled
- Wrong hires and mis-hires are avoided earlier
- Interview panels regain confidence in recruiter shortlists
- Hiring process becomes sharper, faster, and more predictable

Example ROI:

If a CTO, tech lead, and senior engineer spend 5 hours/week interviewing weak candidates, and their blended cost is ₹5,000/hour, the company wastes ₹1L/month in technical interview bandwidth alone.

If engineer-led screening saves even 20–30 hours of senior engineering time per month, the engagement fee can be justified before even counting faster role closure or better hire quality.

ROI Multiple:

For a ₹1L role engagement fee, saving ₹2L worth of engineering interview time creates 2x ROI.
For a ₹1L fee, closing one critical senior engineer 30 days faster can unlock product delivery worth much more than the fee.
For a ₹2L/month retainer, saving 50 engineering hours/month at ₹5,000/hour creates ₹2.5L value before hiring impact.

Best ROI Clients:

Tech companies hiring senior Backend, Platform, Data, GenAI Application, and Engineering Lead roles, where interview panels are overloaded, roles are urgent, engineering salaries are high, and weak technical screening is delaying product delivery.

TAM analysis

TAM Analysis:

The niche is large enough because the problem is horizontal: any tech company hiring senior Backend, Platform, Data, GenAI Application, or Engineering Lead talent faces screening quality, interview bandwidth, and role closure problems.

Global Market:

Recruitment, staffing, talent acquisition software, AI recruitment platforms, coding assessments, and technical interview services are already large markets. This proves companies actively spend money to reduce hiring friction, improve candidate quality, and close roles faster.

India TAM:

India's tech industry is around \$315B in FY26, with strong hiring demand shifting toward AI, cloud, data, cybersecurity, platform, and senior engineering roles. India also has 1.8L+ recognised startups and 2,100+ GCCs employing 2.36M professionals. Best-fit target is likely 5,000–20,000 tech companies hiring senior engineering roles.

US TAM:

The US has a very large software and technology employer base. Software developer, QA, and tester employment is projected to grow much faster than average from 2024–2034. Best-fit target is likely 30,000–100,000 tech companies, SaaS firms, AI companies, and engineering-led businesses hiring senior technical talent.

UAE / Dubai TAM:

UAE is becoming a strong tech, AI, fintech, and startup hub. Best-fit target is likely 2,000–8,000 companies across startups, SaaS, fintech, digital services, AI companies, and regional tech teams needing strong engineering talent.

Singapore TAM:

Singapore has 4,500+ tech startups and is a major APAC startup and technology hub. Best-fit target is likely 1,500–5,000 companies hiring regional Backend, Data, Platform, AI, and Engineering Lead talent.

Best-Fit SAM:

The realistic serviceable market is not all employers. Best-fit buyers are tech companies with urgent senior engineering roles, active hiring budgets, overloaded interview panels, poor shortlist quality, and pain from generic recruiters or weak technical screening.

High-Ticket Target Pool:

Across India, US, UAE, Singapore, UK, Canada, and Australia, the realistic high-ticket target pool is likely 50,000–200,000 tech companies that may pay for engineer-led technical screening and vetted shortlist delivery.

Initial SOM:

First 12-month reachable market: 300–1,000 India/UAE/Singapore tech companies through LinkedIn outbound, cold email, CTO/founder communities, referrals, HR consultants, and engineering leader networks.

Conclusion:

The market is large enough. The best starting geography is India for proof and case studies. UAE/Singapore for higher-ticket expansion, and US/UK/Australia/Canada after the TechFit Hiring Engine is proven.
